

For 9/7 from 9/6

IMPORTANT

We have conjectured that

$$A(n) = (2n-1)^n - c(n).$$

where $c(n)$ is a polynomial of degree $n-2 \geq 0$.

Next Steps are to find a function for the first coefficients of $c(n)$ and possibly extrapolate

$$c(n) = f(n) + c_2(n) \Rightarrow A(n) = (2n-1)^n - f(n) + c_2(n)$$

and so create a series

$$A(n) = \sum_{i=1}^{\infty} f_i(n) \quad \text{Similar to a Taylor Series}$$

from that extrapolate a closed or semi-closed form for $A(n)$

or if there is no extrapolatable pattern estimate $A(n)$ using Taylor series operation on a finite sum
